Category: MONITOR	Estimated time: 0.00 hour
Target version:	Ergonomic impact:
Sponsor:	
Functional impact: removing monitor component	
Description	
<p>I think that we could merge the service and monitor components.</p> <p>It could work like that :</p> <ul style="list-style-type: none">- Add a radio button in the definition of a service : Monitor (yes/no). It will do a getCapabilities on the service.- Add global parameters in the service component to fix url of the monitor service, email to alert when a status service change, the frequency of the requests- Add a Monitor menu entry to display results of the monitoring with a selection of service monitored and a period that will display a D3 graph including response time and status changes <p>The servlet works great, we could just keep it as it is</p>

I am personally in favor of such changes (these are directions PSC had already discussed) BUT it needs more description and layouts proposals (wireframe for example).

Both functional impact and ergonomic impacts MUST be addressed.

What about current MONITOR entry in backend ?

What about other parameters (SLA, advanced requests such as GetMap..., etc...) ?
